Please amend claims 15 and 16 as follows:

- 14. (Amended) The <u>method</u> [signal processing system] of claim 14 wherein the selected format comprises pulse code modulation.
- 16. (Amended) The <u>method</u> [signal processing system] of claim 14 wherein said one of the formats not selected by the encoder comprises information modulated by a voiceband carrier.

Please add claims 71-94 as follows:

-- 71. A signal processing system, comprising:

encoding means for selectively encoding information having one format from a signal having a plurality of different formats, one of the different formats not selected by the encoding means being modulated; and

driving means for selectively outputting onto a packet based network the encoded information and demodulated information from said one of the different formats. --

- -- 72. The signal processing system of claim 71 wherein the selected format comprises pulse code modulation. --
- 1 -- 73. The signal processing system of claim 71 wherein said one
- of the formats not selected by the encoding means comprises
- 3 information modulated by a voiceband carrier. --
- 1 -- 74. The signal processing system of claim 71 wherein the
- 2 encoded information comprises voice signals. --

- 75. The signal processing system of claim 74 further comprising suppression means for suppressing the voice signals without speech. --
- 1 -- 76. The signal processing system of claim 75 further 2 comprising means for generating comfort noise parameters when the 3 suppression means suppresses the voice signals, said comfort noise 4 parameters being selectively outputted by the driving means. --
- 1 -- 77. The signal processing system of claim 71 further comprising means for decoding packets of information from the packet based network. --
- 1 -- 78. The signal processing system of claim 77 wherein the 2 information packets include voice signals, the signal processing 3 system further comprising means for detecting the voice signals 4 without speech, and noise generation means for inserting comfort 5 noise in place of the voice signals without speech. --
- -- 79. The signal processing system of claim 78 further comprising means for generating comfort noise parameters from at least a portion of the voice signals without speech, the noise generation means being responsive to the comfort noise parameters.
- 1 -- 80. The signal processing system of claim 77 wherein the 2 information packets include voice signals, the signal processing 3 system further comprising means for detecting lost voice signals, 4 and means for processing the voice signals to compensate for the 5 lost voice signals. --
- 1 -- 81. The signal processing system of claim 71 further comprising compensation means for receiving packets of information

- of varying delay from the packet based network and compensating for the delay variation of the information packets. --
- 1 -- 82. The signal processing system of claim 81 wherein the 2 compensation means comprises queue means for buffering the 3 received information for a holding time, and means for adaptively 4 adjusting the holding time of the received information. --
- 1 -- 83. Computer-readable media embodying a program of 2 instructions executable by a computer to perform a method of 3 processing signals, the method comprising:

selectively encoding information having one format from a signal having a plurality of formats; and

selectively outputting onto a packet based network the encoded information and demodulated information from one of the formats not selected. --

- 1 -- 84. The computer-readable media of claim 83 wherein the selected format comprises pulse code modulation. --
- 1 -- 85. The computer-readable media of claim 83 wherein said one 2 of the formats not selected by the encoder comprises information 3 modulated by a voiceband carrier. --
- 1 -- 86. The computer-readable media of claim 83 wherein the extracted information includes voice signals. --
- 1 -- 87. The computer-readable media of claim 86 wherein the 2 method further comprises suppressing the voice signals when the 3 voice signals do not comprise speech. --

7

8

- 1 -- 88. The computer-readable media of claim 87 wherein the
- 2 suppression of the voice signals comprises generating comfort noise
- 3 parameters in place thereof. --
- 1 -- 89. The computer-readable media of claim 83 wherein the
- 2 method further comprises receiving information packets of varying
- delay from the packet based network, and compensating for the delay
- 4 variation of the information packets. --
- 1 -- 90. The computer-readable media of claim 89 wherein the
- 2 information packet compensation comprises generating an isochronous
- 3 stream of the information.
- 1 -- 91. The computer-readable media of claim 90 wherein the
- 2 isochronous stream generation comprises adaptively buffering the
- 3 information. --
- 1 -- 92. The computer-readable media of claim 83 wherein the
- 2 method further comprises receiving packets of voice signals from
- 3 the packet based network, identifying the received voice signals
- 4 without speech, and inserting comfort noise in place of the
- 5 identified voice signals without speech. \ --
- 1 -- 93. The computer-readable media of \setminus claim 93 wherein the
- 2 comfort noise insertion comprises estimating comfort noise in
- 3 response to at least a portion of the redeived voice signals
- 4 without speech. --
- 1 -- 94. The computer-readable media of claim 83 wherein the
- 2 method further comprises receiving packets of vaice signals from
- 3 the packet based network, detecting lost voice signals, decoding
- 4 the received voice signals, and processing the \backslash decoded voice
- 5 signals to compensate for the lost voice signals.
